

Question Paper

Conducted by the Central Board of Secondary Education (CBSE)

Time Allowed: 3 Hours

Maximum Marks: 70

General Instructions

- (i) This question paper contains **27 questions**. All questions are **compulsory**.
- (ii) The question paper is divided into Sections A, B, C, D.
- (iii) Section A - Questions 1 to 5 carry 1 mark each.
- (iv) Section B - Questions 6 to 12 carry 2 marks each.
- (v) Section C - Questions 13 to 24 carry 3 marks each.
- (vi) Section D - Questions 25 to 27 carry 5 marks each.
- (vii) There is no overall choice. Where an internal choice is provided, attempt only one of the alternatives.
- (viii) Use of calculators is not permitted.

You may use the following values of physical constants wherever necessary:

$$\begin{aligned}c &= 3 \times 10^8 \text{ m/s} \\h &= 6.63 \times 10^{-34} \text{ Js} \\e &= 1.6 \times 10^{-19} \text{ C} \\\mu_0 &= 4\pi \times 10^{-7} \text{ T m A}^{-1} \\\epsilon_0 &= 8.854 \times 10^{-12} \text{ C}^2 \text{ N}^{-1} \text{ m}^{-2} \\\frac{1}{4\pi\epsilon_0} &= 9 \times 10^9 \text{ N m}^2 \text{ C}^{-2}\end{aligned}$$

$$\begin{aligned}\text{Mass of electron } (m_e) &= 9.1 \times 10^{-31} \text{ kg} \\\text{Mass of neutron} &= 1.675 \times 10^{-27} \text{ kg} \\\text{Mass of proton} &= 1.673 \times 10^{-27} \text{ kg} \\\text{Avogadro's number} &= 6.023 \times 10^{23} \text{ per gm mole} \\\text{Boltzmann constant} &= 1.38 \times 10^{-23} \text{ JK}^{-1}\end{aligned}$$

Section A

1. Define intensity of radiation based on photon picture of light.

2. State the condition under which a large magnification can be achieved in an astronomical telescope.

OR

How does the angle of minimum deviation of a glass prism vary if the incident violet light is replaced by red light?

3. Draw a plot of resistivity of copper as a function of temperature.

4. Two metallic spheres A and B kept on insulating stands are in contact with each other. A positively charged rod P is brought near sphere A. The two spheres are separated from each other, and the rod P is removed. What will be the nature of charges on spheres A and B?

OR

A metal sphere is kept on an insulating stand. A negatively charged rod is brought near it, then the sphere is earthed. On removing the earthing, and taking the negatively charged rod away, what will be the nature of charge on the sphere? Give reason for your answer.

5. Write the function of receiver in communication system.

Section B

6. Plot a graph showing the variation of undecayed nuclei N versus time t . From the graph, find out how one can determine the half-life and average life of the radioactive nuclei.

7. (a) Which property of nuclear force explains the constancy of binding energy per nucleon $\left(\frac{B}{A}\right)$ for nuclei in the range $20 < A < 170$?

(b) Complete the following nuclear reactions:

8. Obtain Bohr's quantisation condition for angular momentum of electron orbiting in n^{th} orbit in hydrogen atom on the basis of the wave picture of an electron using de Broglie hypothesis.

9. The figure shows a network of five capacitors connected to a 100 V supply. Calculate the total energy stored in the network.

10. A 0.5 m long solenoid of 10 turns/cm has area of cross-section 1 cm^2 . Calculate the voltage induced across its ends if the current in the solenoid is changed from 1 A to 2 A in 0.1 s.

OR

A small flat search coil of area 5 cm^2 with 140 closely wound turns is placed between the poles of a powerful magnet producing magnetic field 0.09 T and then quickly removed out of the field region. Calculate

- (a) change of magnetic flux through the coil, and
(b) emf induced in the coil.

11. In the case of a concave mirror of focal length f , when an object is kept between f and $2f$, show that its image is formed beyond $2f$.

12. Five point charges, each of charge $+q$ are placed on five vertices of a regular hexagon of side l . Find the magnitude of the resultant force on a charge $-q$ placed at the centre of the hexagon.

OR

A simple pendulum consists of a small sphere of mass m suspended by a thread of length l . The sphere carries a positive charge q . The pendulum is placed in a uniform electric field of strength E directed vertically downwards. Find the period of oscillation of the pendulum due to the electrostatic force acting on the sphere, neglecting the effect of the gravitational force.

Section C

13. (a) An ac circuit as shown in the figure has an inductor of inductance L and a resistor of resistance R connected in series. Using the phasor diagram, explain why the voltage in the circuit will lead the current in phase.

(b) The potential difference across the resistor is 160 V and that across the inductor is 120 V. Find the effective value of the applied voltage. If the effective current in the circuit be 1.0 A, calculate the total impedance of the circuit.

(c) What will be the potential difference in the circuit when direct current is passed through the circuit?

OR

An ac circuit consists of a series combination of circuit elements X and Y . The current is ahead of the voltage in phase by $\frac{\pi}{4}$. If element X is a pure resistor of 100Ω ,

(a) name the circuit element Y .

(b) calculate the rms value of current, if rms value of voltage is 141 V.

(c) what will happen if the ac source is replaced by a dc source?

14. Write the range of the wavelength of the following electromagnetic radiations:

(a) Infrared rays

(b) Ultraviolet rays

(c) γ -rays

Write one use of each of the above.

15. (a) Plot a graph to show the variation of stopping potential with frequency of incident radiation in relation to photoelectric effect.

(b) Use Einstein's photoelectric equation to show how from this graph, (i) Threshold frequency, and (ii) Planck's constant can be determined.

OR

(a) How does one explain the emission of electrons from a photosensitive surface with the help of Einstein's photoelectric equation?

(b) Work function of aluminium is 4.2 eV. If two photons each of energy 2.5 eV are incident on its surface, will the emission of electrons take place? Justify your answer.

(c) The stopping potential in an experiment on photoelectric effect is 1.5 V. What is the maximum kinetic energy of the photoelectrons emitted? Calculate in Joules.

16. (a) Explain how an unpolarised light gets polarised when incident on the interface separating the two transparent media.
- (b) Green light is incident at the polarising angle on a certain transparent medium. The angle of refraction is 30° . Find
- polarising angle, and
 - refractive index of the medium.

17. In the circuit shown in the figure, find the value of the current shown in the ammeter A .

18. (a) Obtain the expression for the current flowing through a conductor having number density of the electrons n , area of cross-section A in terms of the drift velocity v_d .
- (b) How does the resistivity of a semiconductor change with rise of temperature? Explain.
19. (a) Obtain the expression for the current flowing through a conductor having number density of electrons n , area of cross-section A , in terms of the drift velocity v_d .
- (b) How does the resistivity of a semiconductor change with rise of temperature? Explain.

20. (a)(i) Write the truth tables of the logic gates marked P and Q in the given circuit.

- Write the truth table for the circuit.
- Why are NOR gates considered as universal gates?

OR

- (a) Explain how a potential barrier is developed in a p-n junction diode.
- (b) Draw the circuit arrangement for studying the V-I characteristics of a p-n junction diode in reverse bias. Plot the V-I characteristics in this case.

21. (a) How are eddy currents generated in a conductor which is subjected to a magnetic field?
- (b) Write two examples of their useful applications.
- (c) How can the disadvantages of eddy currents be minimized?

22. Define the dipole moment of a magnetic dipole. Write its S.I. unit.

Obtain the expression for the torque acting on a magnetic dipole placed in an external uniform magnetic field.

23. (a) What do you mean by bandwidth of a signal? Give its importance.
- (b) Differentiate between Analog and Digital communication.
- (c) Write the functions of transducer and repeaters.

24. Define the dipole moment of a magnetic dipole. Write its S.I. unit. Obtain the expression for the torque acting on a magnetic dipole placed in an external uniform magnetic field.

Section D

25. (a) Draw a circuit diagram of an n-p-n transistor with its emitter-base junction forward biased and base-collector junction reverse biased. Briefly describe its working. Explain how a transistor in its active state exhibits a low resistance at its emitter-base junction and high resistance at its base-collector junction.

(b) Derive the expression for the voltage gain of a transistor amplifier in CE configuration in terms of the load resistance R_L , current gain α and input resistance. Explain why input and output voltages are in opposite phase.

OR

(a) Write the important considerations which are to be taken into account while fabricating a p-n junction diode to be used as a Light Emitting Diode (LED). What should be the order of band gap of an LED, if it is required to emit light in the visible range? Draw a circuit diagram and explain its action.

(b) Draw the V-I characteristics of an LED. State two advantages of LED lamps over conventional incandescent lamps.

26. (a) State and explain the law used to determine magnetic field at a point due to a current element. Derive the expression for the magnetic field due to a circular current carrying loop of radius r at its centre.

(b) A long wire with a small current element of length 1 cm is placed at the origin and carries a current of 10 A along the X-axis. Find the magnitude and direction of the magnetic field due to the element on the Y-axis at a distance 0.5 m from it.

OR

(a) Derive the expression for the magnetic field due to a current carrying coil of radius r at a distance x from the centre along the X-axis.

(b) A straight wire carrying a current of 5 A is bent into a semicircular arc of radius 2 cm. Find the magnitude and direction of the magnetic field at the centre of the arc.

27. (a) Can the interference pattern be produced by two independent monochromatic sources of light? Explain.

(b) The intensity at the central maximum (O) in a Young's double slit experimental set-up shown in the figure is I_0 . If the distance OP equals one-third of the fringe width of the pattern, show that the intensity at point P , would equal $\frac{I_0}{4}$.

(c) In Young's double slit experiment, the slits are separated by 0.5 mm and screen is placed 1.0 m away from the slit. It is found that the 5th bright fringe is at a distance of 4.13 mm from the 2nd dark fringe. Find the wavelength of light used.

OR

(a) Derive the relation $a \sin \theta = \lambda$ for the first minimum of the diffraction pattern produced due to a single slit of width ' a ' using light of wavelength λ .

(b) State with reason, how the linear width of central maximum will be affected if (i) monochromatic yellow light is replaced with red light, and (ii) distance between the slit and the screen is increased.

(c) Using the monochromatic light of same wavelength in the experimental set-up of the diffraction pattern as well as in the interference pattern where the slit separation is 1 mm, 10 interference fringes are found to be within the central maximum of the diffraction pattern. Determine the width of the single slit, if the screen is kept at the same distance from the slit in the two cases.
